

## 100% natural timber large format panels for external facades.

**Parklex Facade is an extraordinary natural timber panel manufactured to withstand the natural environment. The timber has been specifically treated to provide long term protection against degradation from cold, heat, wind, snow, rain and direct sunlight.**

The new Parklex Facade includes **Everlook®**, a special overlay that dramatically increases the normal life of the panel, improving UV resistance and colour stability. It also allows for the development of new panels with an extensive range of finishes.

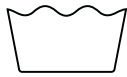

## Everlook<sup>®</sup>, prolonging the life-cycle.

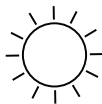

## Quality that's plain to see.

### Water resistant

Parklex is successfully installed in a wide range of climatic environments throughout the world. Our extensive manufacturing experience and commitment to R & D has allowed us to develop a unique timber building material able to withstand the harshest weather conditions. In addition, our process provides timber panels for use in the aggressive environments created in and around swimming pools, spas and shower rooms.

### Sun resistant

One of the enhanced features of the new Facade panel is its high resistance to UV degradation, sunlight being the harshest natural element. As a progressive company, at Parklex we constantly thrive to deliver superior performance by way of advanced manufacturing techniques in panel production. Our materials offer the highest level of colour stability possible, whilst maintaining the beauty and variations found with natural timber.

### Finishes

**Everlook**, our exclusive UV resistant overlay, has enabled us to extend our range of finishes. This provides specifiers and end users with greater possibilities in terms of veneer species and tone, creating truly unique building facades.

### Anti-graffiti and maintenance

It is an unfortunate fact of life that many of the best architectural projects have their appearance marred by the random application of graffiti, often applied with cellulose based spray paints. The surface of Parklex Facade has been specifically designed to ensure the simple removal of the graffiti, without damage to the panel characteristics or appearance. In addition, Parklex Facade resists soiling by airborne pollutants, and requires a very low frequency of general cleaning. Both important factors when considering the ongoing cost of building maintenance.

### Natural timber veneers

As with all Parklex products, the Facade line is manufactured from natural timber veneers. Our raw material is procured within very strict tolerances for both appearance and quality, and all panels are made from hand selected veneers. Our manufacturing process creates a panel with strength and durability, characteristics essential to guarantee the optimal performance of modern rain screen facades.

### Long term performance

At Parklex we don't settle for simply complying with the necessary regulations. We strive to produce materials which far exceed the performance requirements laid down in the European Regulation EN 438-6:2005. This norm specifies a result after Artificial Weather Conditions Resistance Tests of 3.000 hours. After extensive development, Parklex Facade has achieved a result for most finishes of more than twice the published requirement. As leaders in our field, we don't just comply with regulations, we exceed. Which is exactly what our clients expect.

Parklex Facade will be available in April 2008.
